

GREEN PROCUREMENT Policy

Purpose:

Epping Views Primary School is committed to the use and purchase of environmentally and socially responsible materials, products and services whenever they perform satisfactorily, are safe and are value for money over the lifetime of the product.

EVPS's objective is to reduce impacts on the environment and human health through changing purchasing behaviour. By adopting a Green Procurement Policy, the school aims to:

- Encourage the sustainable use of resources;
- Reduce its impact on the environment (ecological footprint);
- Eliminate unnecessary purchasing;
- Reduce waste to landfill;
- Improve environmental health;
- Improve human health;
- Support sustainable long-term markets for recyclable materials; and
- Contribute to community progress towards sustainability.

Guidelines:

- It is the responsibility of the purchasing officer to be aware of potential impacts that a products' life cycle will have on environmental and human health and to use the school's Green Procurement Checklist when purchasing goods, materials or services to ensure the Green Procurement Policy is met.
- Green Procurement involves taking into account the whole life cycle of a product, covering aspects such as the acquisition of raw materials used, the toxicity of the product or its manufacturing processes, if it contains any recycled materials, the amount of packaging used for the product, whether it is energy or water efficient, maintenance required, potential for reuse or recycling, disposal options, where it is made and if the product is supporting Fair Trade.

To achieve the goals of this policy the following objectives and principles have been established:

1. Minimise Unnecessary Purchasing
2. Minimise Waste
3. Minimise Toxicity
4. Minimise Habitat Destruction
5. Minimise Soil Degradation
6. Minimise Greenhouse Gas Emissions
7. Maximise Energy Efficiency
8. Maximise Water Efficiency
9. Maximise Value for Money
10. Maximise Fair Trade opportunities
11. Maximise the Purchase of Eco- Labelled/ Environmentally Preferred Products/ Services
12. Maximise Education for Sustainability opportunities
13. Maximise Safety

The following environmental attributes should be considered desirable:

- Australian Produced and Made label
- Biodegradable
- Bulk purchasing
- Carbon Neutral
- Carcinogen free
- Chlorofluorocarbon (CFC) free
- Compostable
- Durable
- Endocrine disruptor free
- Energy Efficient- high energy star rating
- Environmentally Sustainable Design
- Fair Trade certification
- Forest Stewardship Council certification
- Free Range Farmers Association accredited
- Genetically Modified Organism (GMO) Free
- Good Environmental Choice Australia labelled
- Green Power accredited
- Greenhouse Friendly certified
- Heavy Metal free (eg. no lead, mercury)
- ISO 14001 compliant (or equivalent)
- Locally manufactured or grown
- Low Volatile Organic Compound (VOC) content/ off gassing
- Low-toxicity
- Lower embodied energy/ water
- Organic Certification
- Marine Stewardship Council certified
- Renewable materials
- Renewable Energy
- Recyclable
- Recycled post consumer content
- Recyclable consumables
- Recyclable packaging
- Reduced packaging
- Reduced greenhouse gas emissions
- Refurbished
- Reusable
- Upgradeable
- Water Efficient- high WELS ratio

Actions/ Implementation

Within 6 months of policy ratification, Epping Views Primary School will:

- nominate a staff member to co-ordinate the development and implementation of this policy
- ensure that staff have access to information on environmentally preferred products
- actively promote environmental purchasing to the community
- require its contractors and consultants to comply with this policy
- establish a staff education program for the implementation of this policy eg use of

checklists when purchasing goods, materials or services

Green Purchase Checklist

Use the RSS AuSSI Vic Green Purchase Checklist or the checklist in the How to Reduce, Reuse and Recycle Waste in Schools book (p 151) manual to assess whether a product or service is environmentally preferred. Also use this checklist (or an amended version) in tender documents for contract tenderers to address.

Evaluation:

Within 2 years of policy ratification Epping Views Primary School will:

- review environmental, purchasing and quality criteria and develop a program to support the application of this policy
- review purchasing specifications, tender documentation, consultant's briefs and contracts for compliance with this policy

This policy was last ratified by School Council in....

November 2008

Green Procurement involves taking into account the whole life cycle of a product, covering aspects such as the acquisition of raw materials used, the toxicity of the product or its manufacturing processes, if it contains any recycled materials, the amount of packaging used for the product, whether it is energy or water efficient, maintenance required, potential for reuse or recycling, disposal options, where it is made and if the product is supporting Fair Trade.

To achieve the goals of this policy the following objectives and principles have been established:

a) Minimise Unnecessary Purchasing

- Purchases must only be made once it has been determined that the product, material or service is necessary.
- Does the item already exist in the school? How many are *really* necessary?

b) Minimise Waste

Purchasing decisions must be made in the context of the waste hierarchy to:

AVOID/ RETHINK

- Functions or tasks should be carried out without using materials that generate waste eg. send information electronically instead of on paper.
- Where practical and cost effective, products will be ordered in appropriate quantities to avoid having to dispose of obsolete products.
- Biodegradable products should be used wherever possible eg. compostable paper plates

REDUCE

- Use less in the first place and avoid waste eg. purchase in bulk to reduce packaging, print double sided.

REUSE

- Ensure that new purchases are durable, have a long service life and are easy to maintain, repair and upgrade.
- Use the same item more than once (eg cutlery, crockery) and extend the useful life of products and equipment before replacing an item. Aim to refill, re-use or repair an existing product.
- Borrow items from friends or other schools to avoid buying products for a one off use.
- Equipment purchased or rented by the school are to be compatible, whenever practicable, with the use of recycled-content or re-manufactured products (e.g. photocopy machines- recycled/ recyclable toner cartridges, recycled content paper).
- Obsolete items still in good working order should be given to charity or sold to extend it's life.

RECYCLE

- Products should contain recycled materials wherever possible.
- Paper should be purchased with at least 30% recycled content, preferably post consumer.
- Choose products which can be recycled at the end of their life.
- Recycle goods wherever possible- investigate recycling schemes available.
- Some electrical goods suppliers take back products at the end of their life for recycling- investigate this option when purchasing equipment.

DISPOSE OF WASTE THOUGHTFULLY

- Waste to landfill should not contain toxic or recyclable items such as batteries, fluorescent tubes, compact fluorescent lamps, computers, LCDs/ TVs, paint, chemicals, mobile phones, oil or other toxic items. Disposal schemes are available for all of these items in Victoria.

c) Minimise Toxicity

- Products and materials should not release toxic or polluting substances that can affect human health and pollute water, land or air.
- Products and materials with the potential for safe, non-hazardous disposal should be chosen wherever possible.
- Choose biodegradable products where possible.
- Cleaning products should be biodegradable, low in Sodium and Phosphate (PO₄), and free of carcinogens, endocrine disruptors, VOCs and scheduled poisons (S5, S6 or S7 products). Use

of these products must not result in discharges of toxic chemicals to waterways at any stage of their life cycle.

- Avoid products containing hazardous materials like Lead (Pb) or Mercury (Hg) wherever possible.
- Where hazardous materials must be purchased (eg fluorescent tubes containing Mercury), products should be used and disposed of in the most safe and environmentally friendly manner.

d) Minimise Habitat Destruction

- Paper and wood products should be obtained from recycled, plantation, salvaged or sustainably managed Forest Stewardship Council (FSC) certified sources.
- Standard copy paper should be purchased with at least 30% recycled content, preferably post consumer. The higher the % recycled content the better.
- When using virgin paper products, look for Forest Stewardship Council (FSC) certified products.
- Cleaning products should be low in Phosphate (PO_4), biodegradable and free of carcinogens and endocrine disruptors. Use of these products must not result in discharges of toxic chemicals to waterways at any stage of their life cycle.
- Paint and other liquid wastes must be disposed of properly and must not result in discharges of toxic chemicals to waterways.

e) Minimise Soil Degradation

- Products, materials and services should not degrade or pollute the soil, or result in erosion through their use.
- Organic products should be sourced wherever possible.

f) Minimise Greenhouse Gas Emissions

- Products and materials must be energy efficient (see next principle below).
- Use Green Power and reduce reliance on fossil fuels.
- Goods should not be transported long distances.

g) Maximise Energy Efficiency

- Products and materials must be energy efficient- check the **energy star rating** and efficiency features are the best available for the cost over the lifetime of the product.

h) Maximise Water Efficiency

- Products and materials must be water efficient- check the **water efficiency label** rating and efficiency features are the best available for the cost over the lifetime of the product.

i) Maximise Value for Money

- Purchasing decisions by the school and all employees must be made on the basis of value for money rather than just the cheapest up-front purchase price.
- A **cost benefit analysis** (using the benefit: cost ratio of~ benefits/ (investment + operating costs)) may need to be undertaken on larger purchases to ascertain whether larger upfront purchase costs of materials or equipment is then offset by lower running and maintenance costs.
- The calculated benefit: cost ratio should be over 1. Payback period (days) can be calculated by dividing 365 by the ratio. Usually the pay back period of a product should be during its lifetime; however a product doesn't necessarily have to have a payback period within its life if it has a very important benefit eg addressing OH&S issues, climate change etc.
- Where products, materials or services that are not environmentally preferred are chosen solely on the basis of cost, the purchasing officer must detail in writing the reasons for not purchasing an environmentally preferred alternative.

- The school recognises that in some cases environmentally preferred products, materials or services may be more expensive than traditional sources and accordingly a price preference of 5% will be implemented under this policy to encourage purchasing of environmentally preferred products.
- The extra costs that may be associated with purchasing environmentally preferred products can be offset by reducing consumption of the product in the first place. eg if energy or paper consumption can be reduced, then the cost savings can respectively go towards purchasing green power or recycled content paper.

j) Maximise Fair Trade opportunities

- The purchase of Fair Trade products ensures disadvantaged farmers and workers in developing countries get better prices for their product, decent working conditions, local sustainability and fair terms of trade. Fairtrade addresses the injustices of conventional trade, and enables the poorest, weakest producers to improve their position and have more control over their lives.

k) Maximise the Purchase of Eco- Labelled/ Environmentally Preferred Products/ Services

- Does the product achieve certification in the major eco-labelling schemes? Please see the Eco- Labelling in Australia section later in this document for guidance on labels to look for.
- Potential suppliers should provide details of their environmental sustainability policy/ plans/ practises. Are they ISO14001 (or equivalent) certified?
- Potential suppliers must meet Green Procurement Policy requirements in tender documents.

l) Maximise Education for Sustainability opportunities

- Can the product, material or service be used in Education for Sustainability activities?

m) Maximise Safety

- Proper MSDS (Material Safety Data Sheets) where applicable are sourced and kept on record.
- Cleaning products should be pH neutral, non-irritating, and free of carcinogens, endocrine disruptors, VOCs, toxicants and scheduled poisons (S5, S6 or S7 products).
- Avoid products containing hazardous materials like Lead (Pb) or Mercury (Hg) wherever possible.
- Where hazardous materials must be purchased (eg fluorescent tubes containing Mercury), products should be used and disposed of in the most safe and environmentally friendly manner.

Green Purchase Checklist

Use the RSS AuSSI Vic Green Purchase Checklist or the checklist in the How to Reduce, Reuse and Recycle Waste in Schools book (p 151) manual to assess whether a product or service is environmentally preferred. Also use this checklist (or an amended version) in tender documents for contract tenderers to address.

Eco- Labelling Schemes in Australia

Not all green claims are the same. By appreciating the relative merit of different labels you can maximise the environmental benefit of your purchasing power. There are three types of eco-labels defined by the International Organisation for Standardisation, whose ISO 14000 series of environmental assessment methods covers environmental management, certification and eco-labelling.

Type I labels (ISO 140024) are the most informative, certifying selective, multi-criteria-based, third-party-certified endorsement of a product.

Type III labels (ISO 14025) certify quantified but non-selective product information based on independent verification against established benchmarks. In other words, the product meets certain standards.

Type II labels (ISO 14021) are self-declared claims, such as 'dolphin-friendly'. You need to make up your own mind about the worth of such labels. (Source: Ecologic, 02/10/2008 http://www.ecologicmedia.com/index.php?option=com_content&task=view&id=34&Itemid=161)

In Australia there are a number of eco-labels or certifications which you can look out for to help guide you in the purchase of goods, materials and services:

Australian Certified Organic certified <http://www.australianorganic.com.au/>

Organic certification is when an organic certifying group audits a business' methods to ensure that they comply with national or international standards for organic farming and processing ie any organic fruit or vegetables, crops, plants or meat products that are raised on a farm certified as organic - that is, they use no artificial fertilisers, pesticides or herbicides and no genetically-modified species.

Australian Grown/ Australian Product label <http://www.australianmade.com.au/productofaustralia>

The Australian Made, Australian Grown symbol is used on close to 10,000 products. Buying Australian Made/ Australian Grown creates jobs, boosts the economy, provides higher levels of environmental protection, reduces transportation/ food miles and improves our standard of living. Sometimes buying Australian grown isn't always the best thing and you need to make some decisions about the whole life cycle of a product eg think carefully about buying rice grown in Australia due to its high water footprint- is it better to buy Thai or Indian rice where water is plentiful despite the length of transportation (food miles)?

Australian National Packaging Covenant www.packagingcovenant.org.au

In addition, the National Packaging Covenant aims to reduce environmental degradation arising from the disposal of used packaging and conserve resources through better product design and production and the reuse and recycling of used packaging materials. It is a voluntary covenant signed by the Australian and New Zealand Environment and Conservation Council Ministers, Local Government and a broad range of industries in the packaging supply chain in 1999. You can check to see on the website of a company has agreed to abide by the covenant.

Energy Rating <http://www.energyrating.gov.au/>

The Energy Rating label enables consumers to compare the energy efficiency of domestic appliances on a fair and equitable basis- the more stars the more energy efficient the product. It also provides incentive for manufacturers to improve the energy performance of appliances.

Energy Star standard <http://www.energystar.gov.au/>

Energy Star is an international standard for energy efficient office equipment including computers, printers and photocopiers, and home electronics such as TVs, audio products and DVD players. Labelled products reduce the amount of energy consumed by either automatically switching to a 'sleep' mode when not in use and/or reducing the amount power used when in 'standby' mode.

Fair Trade certification <http://www.fairtrade.org.uk>

Products carrying the Fairtrade Certification Label are those that have been produced and sold ensuring that the third world producers, workers and communities, normally disadvantaged through current international trade rules, get a fair return for their products and labour. The Label is most commonly found on commodity products, such as coffee, chocolate and tea.

Forest Stewardship Council certification <http://www.fscus.org/>

An international labelling scheme for forest products, which provides a credible guarantee that the product comes from a well managed forest. All forest products carrying the FSC logo have been independently certified as coming from forests that meet the internationally recognised FSC Principles and Criteria of Forest Stewardship. In this way FSC provides an incentive in the market place for good forest stewardship.

Free Range Farmers Association accreditation www.freerangefarmers.com.au

FRFA have an accreditation scheme which is designed to enable consumers to readily identify the product of farms that comply with the Associations published standards for free-range egg production. Such farms will have been inspected by an appointed Independent Inspector to ensure that all management practices are appropriate to the concept of free-range egg production. Additionally processes will be in place to ensure that only eggs produced on an accredited farm are sold as accredited free-range eggs. This includes an audit trail for eggs delivered and bought in from other accredited farms.

Gas Rating <http://www.energyrating.gov.au/gas>

The Gas Rating label enables consumers to compare the efficiency of gas appliances (gas space heaters and water heaters) on a fair and equitable basis- the more stars the more energy efficient the product. It also provides incentive for manufacturers to improve the performance of appliances.

Good Environmental Choice Australia label www.aela.org.au

The Good Environmental Choice Label is the only environmental labelling program in Australia which indicates the environmental performance of a product from a whole of product life perspective for consumer goods. The label is awarded to products that meet voluntary environmental performance standards which have been created and assessed in conformance to international environmental labelling standards.

Greenhouse Friendly label <http://www.climatechange.gov.au/greenhousefriendly/index.html>

The Greenhouse Friendly™ initiative is a concrete way for consumers to take action against global warming by purchasing greenhouse-neutral products or services, that is, products and services with zero greenhouse impacts.

Green Power accreditation <http://www.greenpower.gov.au/home.aspx>

Green Power Accredited products are renewable energy products endorsed by a collection of state governments that manage the GreenPower program. For a renewable energy product to gain endorsement from the GreenPower program it must be generated from: Eligible renewable energy sources that meet strict environmental standards; and A new renewable energy facility that was built since January 1997. (Other renewable energy exists, but it may not be accredited because it was built before 1997, and was already contributing energy to the electricity grid).

Green Star Building Rating <http://www.gbca.org.au/green-star/certification/>

Green Star is a comprehensive, national, voluntary environmental rating scheme that evaluates the environmental design and achievements of buildings.

ISO 14001 compliance <http://www.iso.org/iso/home.htm>

The ISO 14000 environmental management standards exist to help organizations minimize how their operations negatively affect the environment (cause adverse changes to air, water, or land) and comply with applicable laws and regulations. ISO 14001 is the international specification for an environmental management system (EMS). It specifies requirements for establishing an environmental policy, determining environmental aspects and impacts of products/activities/services, planning environmental objectives and measurable targets, implementation and operation of programs to meet objectives and targets, checking and corrective action, and management review. Source: Wikipedia

Marine Stewardship Council certification <http://www.msc.org/>

The MSC's fishery certification program and seafood eco-label recognise and reward sustainable fishing. We are a global organisation working with fisheries, seafood companies, scientists, conservation groups and the public to promote the best environmental choice in seafood.

NASSA Organic certification <http://www.nasaa.com.au/>

As with the Australian Organic, they use no artificial substances in farming. Also state that "humane care of animals, active soil care, pollution reduction, erosion control, shelter belts, efficient water usage and proper food handling are all part of the ethos of the organic producer."

Water Efficiency Labelling Scheme <http://www.waterrating.gov.au/>

WELS is Australia's water efficiency labelling scheme. It allows consumers to compare the water efficiency of different products. The rating system has six stars, with the more stars the better. The labels also show a water consumption or water flow figure.

Useful Guides

Ecobuy www.ecobuy.org.au

ECO-Buy is an award winning not for profit company that supports organisations in purchasing environmentally preferable products and operates as a Centre of Excellence in environmental purchasing

Ecospecifier <http://www.ecospecifier.org/>

A knowledge base of over 3500 eco-products, eco-materials, technologies and resources, the leading global source of sustainable development & life-cycle assessed green product information.

Energy Rating <http://www.energyrating.gov.au/>

The Energy Rating label enables consumers to compare the energy efficiency of domestic appliances on a fair and equitable basis- the more stars the more energy efficient the product. Search the database for information on products.

Ethical Shopping Guide <http://www.ethical.org.au/>

The Ethical Consumer Guide gives you the low-down on the environmental and social record of companies behind common brand names. Shop with a clear conscience!

Good Environmental Choice Australia label www.aela.org.au

The Good Environmental Choice Label is the only environmental labelling program in Australia which indicates the environmental performance of a product from a whole of product life perspective for consumer goods. The label is awarded to products that meet voluntary environmental performance standards which have been created and assessed in conformance to international environmental labelling standards.
